ENDODONTICS / ROOT CANAL THERAPY

CAROL E. MANN, DMD

*Trusted, pampered
endodontic care with
a light touch.*

Welcome to our office! Our practice is devoted to the finest endodontic care in the world.

ENDODONTICS CAN SAVE YOUR TOOTH.

Endodontics is the science of treating problems with the nerve inside the tooth. When this tissue or the tissue surrounding the tooth root is diseased or damaged due to decay or trauma, **endodontic** or **root canal** treatment typically can save the tooth.

You may need endodontic treatment, including root canals, if you are experiencing any of the following symptoms:

- **prolonged dental sensitivity to heat or cold**
- **tenderness of teeth to touch and chewing**
- **facial or oral swelling.**

Root Canal Therapy is a highly successful way of regaining your healthy and comfortable smile.

ROOT CANALS

- Most patients who have had root canal done describe them as **virtually painless.**
- Between 1990 and 1999, the number of root canals performed in the United States increased by 13 percent to nearly 16 million.
- After performing the procedure, the endodontist returns the patient to a general dentist to have a crown placed or other restorative work performed.
- **After restoration, the tooth continues to function like any other tooth.**

SAVING NATURAL TEETH

- In a recent survey, 76 percent of participants said they would prefer a root canal to tooth extraction.
- Nearly a third would not sell a healthy front tooth for any amount of money.
- Most people are not aware that **root canal treatment is a viable alternative to tooth extraction.**
- Women are more likely than men to have had a tooth extraction.
- Artificial teeth can limit your ability to chew certain foods necessary to maintain a balanced diet.

Endodontists are dentists with special training in diagnosing and treating oral and facial pain, and problems associated with the inside of the tooth.

Dr. Carol Mann employs a wide range of endodontic procedures to save natural teeth, including performing root canals (the most common endodontic procedure), treating cracked teeth and avulsed teeth (teeth knocked out by injury) and Endodontic Microsurgery.

With the **latest in endodontic technology** at our disposal, including computer generated x-rays, dental microscopes, and ultrasonics, you will have a pleasant experience in a relaxing environment.

After one to two visits with Dr. Mann the root canal will be finished and **you will return to your referring dentist** for completion of the restoration.

Our patients are our most important asset and we strive to develop long lasting, trusting relationships with all of our patients and their dentists.
